

Cross-granularity expert complementarity

Where the gate has a decision to make

Interpretation boundary

The direct role head and the species-to-role mapping disagree on a small but non-zero subset. The one-right / one-wrong subset is the only subset on which expert selection can repair an error. The complete RSG gate raises conditional selection above the HRGV reference in the registered comparisons, while the fusion remains below the true-label oracle diagnostic.

This is an evidence-structure diagnostic from frozen public-specimen experiments. It does not establish a universal MoE advantage, overall classification superiority, open-set recognition, industrial sorting, grade prediction, or recovery performance.
